
Solutions Architect Interview Presentation

Modernizing Infrastructure Delivery for a FinTech Organization

Using StackGen to accelerate cloud adoption and governed self-service

ANDRES FELIPE CADENA VELEZ
SOLUTIONS ARCHITECT

Customer Overview

Customer Background

The Customer

Mid-sized FinTech operating a hybrid on-prem and AWS environment. Rapid growth has outpaced infrastructure delivery capabilities, creating bottlenecks across development and platform teams.

Key Challenges

Inconsistent governance and standards • Slow, manual infrastructure delivery • Heavy platform engineering dependency • Partial Terraform adoption, hard to scale • Complex on-prem to AWS migration

Current State

Client Before StackGen

01

On-Prem Legacy Systems connected to AWS Cloud via manual scripts and partial Terraform

02

Fragmented tooling: Dev teams use AWS Console, manual scripts, and inconsistent Terraform. Platform Team performs manual governance with no central enforcement. Scaling is slow, error-prone, and heavily dependent on platform engineers.

03

Vision & Objectives

Standardize & Govern

Standardize infrastructure provisioning and enforce governance policies consistently across all teams and environments.

Developer Self-Service

Enable developers to deploy compliant infrastructure independently, reducing platform team dependency and accelerating delivery.

Cloud Migration

Support a smooth, secure migration from on-premises legacy systems to AWS with consistent, repeatable cloud environments.

Future State

Client After StackGen

01

Developers use VS Code or Cursor MCP to request infrastructure via StackGen — no Terraform required.

02

Platform Engineering publishes approved Terraform modules and governance policies into StackGen. StackGen automates compliant infrastructure deployment directly to AWS, enforcing standards across every environment.

05

Engineering Workflow

01

Import and reuse existing Terraform modules. Standardize reusable components across all teams and environments.

02

Define and enforce governance policies centrally. Publish approved infrastructure templates — such as payment-service — and monitor compliance and provisioning activity via StackGen.

Key Activities

Platform teams own the guardrails — StackGen enforces them automatically at every deployment, ensuring consistency without manual intervention.

Governance Model

Approved Regions

Deployments restricted to approved AWS regions only, enforced centrally via StackGen governance policies.

Resource Tagging

Mandatory tagging on all provisioned resources, ensuring cost visibility, ownership, and compliance tracking.

Private Databases

All databases deployed as private-only with standard naming conventions enforced at provisioning time.

Developer Self-Service

01

Access StackGen MCP via VS Code or Cursor — browse and select approved, compliant infrastructure templates.

02

Deploy infrastructure without writing Terraform. StackGen handles provisioning, governance, and compliance automatically — no platform team dependency.

Key Benefit

Fast, consistent, and compliant environments on demand — accelerating developer onboarding and time to market.

Business Value Summary

CTO

Faster time to market and reduced delivery risk through standardized, automated infrastructure provisioning.

Platform Engineering

Centralized governance with reusable Terraform modules and policy enforcement across all environments.

Developers

Self-service provisioning and faster onboarding without writing or managing Terraform directly.

Solutions Architect Interview — StackGen

Thank You

StackGen transforms Terraform from a specialist tool into a governed self-service platform, accelerating cloud adoption while maintaining enterprise control.
